Krino v3 — B2 marker-residual decision model

Frozen Qwen3-Reranker-4B with per-type zero-gated residual heads

Status (2026-11-03)

- **B2 + confirm** — validated baseline
  JevBench proxy cc 0.4613, 3 seeds
- **Sweep** — closed
  D20K, LoRA, band, KL 0.5
  KL 0.5 confirm cc: 0.4538 / 0.4545
- **Teacher-CE** — running
  data arm, not architecture

Readout semantics

- `chunk=1`: an option sees only the shared prefix and itself.
- `option_batch=16` expands the prefix KV cache across the batch dimension: same semantics, $2.44\times$ faster.
- The softmax over marker scores is the option distribution.

cc = chance-corrected accuracy on the 231-item JevBench public proxy. Not the official Intelligence board metric.

Loss

$$\mathcal{L} = 1.0 \cdot \mathrm{KL}(p^{base} \,\|\, p) + 0.2 \cdot \mathrm{CE}(z, y)$$

CE target: teacher soft label when present, otherwise the hard label.

Proposed, not in B2: per-epoch band re-scoring with the current head; 4096 long-context arm (blocked on data); full-corpus base-probability cache (96k/195k items, in progress).
